desktop PC chip would increase that ratio to 1500.

 = ENTIRE WORLD POPULATION

=

So, what year did a single typical desktop computer surpass the combined processing power of humanity?

It's easy, though getting harder every day, to invent tasks that a single human can do faster than all the computers in the world. Humans, for example, are probably still far better at looking at a picture of a scene and guessing what just happened:

To test this theory, I sent this picture to my mother and asked her what *she* thought had happened. She immediately replied,² “The kid knocked over the vase and the cat is investigating.”

She cleverly rejected alternate hypotheses, including:

- The cat knocked over the vase.
- The cat jumped out of the vase at the kid.
- The kid was being chased by the cat and tried to climb up the dresser

100 YEARS AGO

DEEPMIND

100 YEARS ON?

Oath of Hippocrates

I swear by Apollo, the Physician, and Aesculapius and health and all-heal and all the Gods and Goddesses that, according to my ability and judgment, I will keep this oath and stipulation:

To reckon him who taught me this art equally dear to me as my parents, to share my substance with him and relieve his necessities if required: to regard his offspring as on the same footing with my own brothers, and to teach them this art if they should wish to learn it, without fee or stipulation, and that by precept, lecture and every other mode of instruction, I will impart a knowledge of the art to my own sons and to those of my teachers, and to disciples bound by a stipulation and oath, according to the law of medicine, but to none others.

I will follow that method of treatment which, according to my ability and judgment, I consider for the benefit of my patients, and abstain from whatever is deleterious and mischievous. I will give no deadly medicine to anyone if asked, nor suggest any such counsel; furthermore, I will not give to a woman an instrument to produce abortion.

With Purity and with Holiness I will pass my life and practice my art. I will not cut a person who is suffering with a stone, but will leave this to be done by practitioners of this work. Into whatever houses I enter I will go into them for the benefit of the sick and will abstain from every voluntary act of mischief and corruption; and further from the seduction of females or males, bond or free.

Whatever, in connection with my professional practice, or not in connection with it, I may see or hear in the lives of men which ought not to be spoken abroad I will not divulge, as reckoning that all such should be kept secret.

While I continue to keep this oath unviolated may it be granted to me to enjoy life and the practice of the art, respected by all men at all times but should I trespass and violate this oath, may the reverse be my lot.

A long time ago in a galaxy far,
far away....

Star Wars Emperor Ian McDiarmid tells his ambulance to wait until he finishes West End play

An award-winning actor who played the evil Emperor in the Star Wars movies was taken ill on stage but instructed an ambulance to wait until the performance had finished before being leaving for hospital.

By Nick Allen

8:51AM BST 24 Oct 2008

Ian McDiarmid, 64, began suffering from dizzy spells towards the end of the play but concealed his condition so well that the audience didn't notice and critics later gave him glowing reviews.

Ian McDiarmid is a highly distinguished stage actor

Backstage staff feared he was suffering a heart attack and called an ambulance ten minutes before the performance was due to end. It arrived seven minutes later.

But the heroic actor finished his performance and then took the curtain call at the Gielgud Theatre in London's West End before getting in the ambulance.

McDiarmid had been playing the Father in Luigi Pirandello's *Six Characters in Search of an Author*.

He is a highly distinguished Scottish stage actor but is most famous for his Hollywood role as the Emperor

Palpatine in George Lucas's Star Wars films.

Edit

Dear Ian, Dr Jack here from 76 Harley Street. Hope you're having a good Christmas holiday. My wife got me the starwars 6 episode box set so we've just been watching you demonstrate the peak of your Dark Side prowess in full HD :). Trust all's well. Very best as ever, jk

ENHANCING THE QUALITY OF LIFE THROUGH HEALTH AND PERFORMANCE SCIENCE.

HUMAN PERFORMANCE SCIENCE

The CHHP Performance Team is housed in a state-of-the-art facility for the assessment of human performance. Our world leading team of specialists operate a range of clinics providing a bespoke service for clients across the performance spectrum from patient to elite athlete. This highly individual approach; using the latest research and technology ensures performance optimisation whatever your goal.

HEALTH & TREATMENT OPTIMISATION

The Centre for Health and Human Performance (CHHP) provides the best in personalised medical care. Our consultant physicians and surgeons are leaders in their fields, internationally recognised for their clinical expertise and research. The unique multidisciplinary care approach provides the very best opinions and access to the most advanced treatment to optimise health for our clients.

SPORT AND EXERCISE MEDICINE

CHHP provides the best in sport and exercise medicine under one roof. The team of world leading specialists take an individualised approach to every problem providing bespoke solutions across the exercise spectrum from first time exercisers to Olympic medallists. The state-of-the-art facilities combined with specialists from medicine, physiotherapy, soft tissue therapy and rehabilitation work as an inter-disciplinary team to solve sport and exercise related issues rapidly returning our clients to optimal health and performance, whatever your goal.

HUMAN PERFORMANCE SCIENCE

DOCTORS AND SCIENTISTS SAID THAT BREAKING THE FOUR-MINUTE MILE WAS IMPOSSIBLE, THAT ONE WOULD DIE IN THE ATTEMPT. THUS, WHEN I GOT UP FROM THE TRACK AFTER COLLAPSING AT THE FINISH LINE, I FIGURED I WAS DEAD.

Abstract

Background: Improving the management of patients with complex chronic disease is a substantial undertaking with the simultaneous goals of improving patient outcomes and controlling costs. Reducing avoidable hospitalization for such patients is a step toward both objectives. Some of the deterioration experienced in chronic disease patients occurs outside the view of their clinicians, and before the patient becomes overtly symptomatic. Home monitoring has been used for more than 20 years to detect deterioration earlier so that the patients could be treated before they became ill enough to require hospitalization. Patient participation is an important requirement for successful home monitoring. There has been some concern that patients would be unwilling or unable to engage in a program that collected multiple measurements. The Cedars-Sinai Cardiology Center provides a high-touch, intense management program for patients with congestive heart failure (CHF). A group of their patients were chosen to join a complex, multidevice home monitoring system to see whether such patients would find value in the additional effort.

Objective: The objective of our study was to determine whether patients already actively engaged in a high-touch intensive management program for CHF would take on the additional burden of a complex home monitoring effort.

Methods: A total of 20 patients from the Cedars-Sinai group were enrolled in a monitoring program utilizing 5 different devices. Anonymous surveys were collected from the patients to assess their satisfaction with the program.

Results: In total, 90% (18/20) completed the program, and 61% (11/20) submitted the survey. Among the 18 patients, overall compliance with the requested measurements was 70%. It was found that 73% (8/11) felt better about their health as a result of the program, whereas another 73% (8/11) believed that the care team now had a better picture of their health.

Conclusions: Substantial patient compliance and satisfaction can be achieved in a sophisticated home monitoring program.

Introduction

The management of chronic disease is a substantial burden, both for the patients and the provider organizations supporting them. In total, 71% of health care expenditures in the United States result from patients with multiple chronic diseases such

as congestive heart failure (CHF), chronic obstructive pulmonary disease (COPD), and diabetes [1]. A substantial fraction of the cost is generated by repeated hospitalization and emergency department (ED) visits [1]. The incidence of chronic disease continues to grow, in part because of an aging population and improved management of chronic diseases. Better acute coronary

A chi-square contingency table analysis was performed on the response data in Table 2, using Microsoft Excel 2016, version 16.0.6965.2115. It did not quite reach statistical significance,

with a *P* value of .12, in part due to lack of independence among the responses. A positive response to one question was likely associated with a positive response to another question.

Discussion

Principal Findings

Several issues arose during the early stages of the project. First, despite what were thought to be careful explanations there was a misunderstanding of wireless and Internet connections among the patients. Several patients claimed they had wireless access when they did not and thus had to be provided with an Internet hot spot (Mifi) to participate. Many of the patients had difficulty with the finger dexterity necessary to close the clasp on the Fitbit. An alcohol-based hand sanitizer was used as a short-acting lubricant to facilitate clasp closure.

A few of the patients relied on a wheeled walker for ambulation. Weight measurements for those patients were unreliable as they were affected by the variations in level of support that each patient needed from the walker. Although we intentionally limited the number of devices requiring active participation by the patients, a few patients initially felt that the measurement process was too complex. The problem seemed to diminish as the patients became more accustomed to the process. Some of the patients had substantially healthier spouses or significant others that provided support and helped the patients with the measurement process. On one hand, there was an advantage to the help provided. However, sometimes the spouse answered questions for the patients or dominated the discussion so that it was difficult to ascertain the patient's level of understanding. It became clear that special care was necessary to ensure that both the patient and the care-giver had the same understanding.

Some of the participants had already been using home monitoring devices such as blood pressure cuffs and weight scales. Some patients were concerned by the different readings from the new devices provided for the study. The team explained that such differences were minor and expected and were not alarming and that data trends were more important. Although

each patient was given personal instruction in the use of devices, most benefited from phone support when setting up the monitors. There were several cases of idiosyncratic behaviors, with some patients calling technical support or not wanting to use a particular device, requiring additional support.

Many previous reports on compliance in home monitoring involved the use of one or two devices. We added a regimen with multiple devices to an existing intense, management program that already placed heavy demands upon the patients. We have shown that home monitoring produces additional value in such a comprehensive environment. Compliance in our group was at least comparable with compliance reported in other studies, confirming that a complex home monitoring regimen is feasible [10,11,14,15].

There was a high level of satisfaction among the patients, with strong feelings that the program improved their comfort with their health and left them more connected with their health care team. The sharp demarcation between patients that were either poorly compliant with the measurement schedule or dropped out of the program emphasized the need for a personalized approach to home monitoring. Despite a robust implementation and training program, some patients stopped taking the measurements. Distinguishing between patients who will participate if given extra support from those who will not engage is an important part of implementing a clinically and economically valuable program.

Limitations

This was a small study with a group of patients chosen who already had a close relationship with their care providers. The patients were chosen by the staff cardiologists to include patients that had been heavy utilizers of acute health services. However, we cannot exclude bias in that selection process, which might affect the results. It may not be generalizable to a broader group

HOW AFFORDABLE IS HEALTHCARE?

Richard Douglas, Department of Health director general of policy, strategy, and finance, has reportedly said that the drive to find further efficiency savings in the NHS will continue after 2015,¹ with the total savings rising from £20bn (€24.6bn; \$31bn) to a possible £50bn by 2019-20. His comments are a startling admission of the long term impact on public services of the global financial crisis and ensuing recession.
